

# SOCIAL DATA SCIENCE

## DATA GATHERING

## On the ethics of web scraping and data journalism

*If an institution publishes data on its website, this data should automatically be public*

*If a regular user can't access the data, we shouldn't try to get it (that would be hacking)*

*Always read the user terms and conditions*

*Always check the `robots.txt` file, which states what is allowed to be scraped*

1. You should check a site's terms and conditions before you scrape them. It's their data and they likely have some rules to govern it.
2. Be nice - A computer will send web requests much quicker than a user can. Make sure you space out your requests a bit so that you don't hammer the site's server.
3. Scrapers break - Sites change their layout all the time. If that happens, be prepared to rewrite your code.
4. Web pages are inconsistent - There's sometimes some manual clean up that has to happen even after you've gotten your data.

# Folketingets hjemmeside ramt af hacker-angreb

Forsøg på at komme ind på Folketingets hjemmeside resulterer i besked om, at siden ikke er tilgængelig.

 [PRINT](#)

DEL ARTIKLEN:

 [MAIL](#)

 [TWITTER](#)

 [FACEBOOK](#)

Folketinget er blevet ramt af et hacker-angreb, bekræfter Finn Tørngren Sørensen, presseansvarlig i Folketinget, over for [Avisen.dk](#).

Siden fredag formiddag har man fået beskeden "Denne webside er ikke tilgængelig", hvis man har forsøgt at komme ind på Folketingets hjemmeside, ft.dk.

- Det er rigtigt, at der er lukket for den eksterne adgang til Folketingets hjemmeside. Vi er under et såkaldt 'Denial of service'-angreb, og det har vi været siden klokken ti i formiddags. Det fungerer på den måde, at vi får så mange opkald til vores hjemmeside, at systemet bliver overbelastet. Derfor har vi måttet lukke ned for adgangen, siger han.

Folketinget har endnu ikke noget overblik over, hvem der står bag hacker-angrebet, eller hvornår hjemmesiden kan komme op at køre igen.

/ritzau/

## HOW DOES A WEB PAGE LOOK LIKE?

<https://sebastianbarfort.github.io/>

`https:  
//en.wikipedia.org/wiki/Table_%28information%29`

`rvest` is a nice R package for scraping web pages that don't have an API

To extract something, you start with `selectorgadget` to figure out which `css` selector matches the data we want

Selectorgadget is a browser extension for quickly extracting desired parts of an HTML page.

With some user feedback, the gadget find out the CSS selector that returns the highlighted page elements.

```
library("rvest")
link = paste0("http://en.wikipedia.org/",
              "wiki/Table_(information)")
link.data = link %>%
  read_html() %>%
  html_node(".wikitable") %>%
  # extract first node with class wikitable
  html_table()
  # then convert the HTML table into a data frame
```

html\_table usually only works on 'nicely' formatted HTML tables.

First name	Last name	Age
Tinu	Elejogun	14
Blaszczyk	Kostrzewski	25
Lily	McGarrett	16
Olatunkboh	Chijiaku	22
Adrienne	Anthoula	22
Axelia	Athanasios	22
Jon-Kabat	Zinn	22

This is a nice format? Really? Yes, really. It's the format used to render tables on webpages (remember: `programming sucks`)

```
<table class="wikitable">
  <tr>
    <th>First name</th>
    <th>Last name</th>
    <th>Age</th>
  </tr>
  <tr>
    <td>Bielat</td>
    <td>Adamczak</td>
    <td>24</td>
  </tr>
  ...
</table>
```

`http://jyllands-posten.dk/`

Assume we want to extract the headlines

- Fire up Selectorgadget
- Find the correct selector
  - `css selector: .artTitle a`
  - Want to use xpath? no problem.

```
css.selector = ".artTitle a"  
link = "http://jyllands-posten.dk/"  
  
jp.data = link %>%  
  read_html() %>%  
  html_nodes(css = css.selector) %>%  
  html_text()
```

```
## [1] "\r\n\t\t\tTruende milliardtab tvinger borgmestre  
## [2] "\r\n\t\t\tHvem er mest undertrykt her? "  
## [3] "\r\n\t\t\tForslag: Slut med burka og dobbelt sta  
## [4] "\r\n\t\t\tDna-spor har ført til ny teori om rute  
## [5] "\r\n\t\t\tLiveblog fra OL: Følg danskerne, stjer
```

Notice that there are still some garbage characters in the scraped text

So we need our string processing skills to clean the scraped data

Can be done in many ways

```
library("stringr")
jp.data1 = jp.data %>%
  str_replace_all(pattern = "\\n|\\t|\\r" ,
                  replacement = "")
```

---

Truende milliardtab tvinger borgmestre til U-vending: Vil sejle udenlandsk a

Hvem er mest undertrykt her?

Forslag: Slut med burka og dobbelt statsborgerskab

Dna-spor har ført til ny teori om ruten til Amerika

Liveblog fra OL: Følg danskerne, stjernerne og de store begivenheder

Cancellara tog OL-guld i enkeltstart

---

`str_trim`: Trim whitespace from start and end of string

```
library("stringr")  
jp.data2 = jp.data %>%  
  str_trim()
```

---

Truende milliardtab tvinger borgmestre til U-vending: Vil sejle udenlandsk a

Hvem er mest undertrykt her?

Forslag: Slut med burka og dobbelt statsborgerskab

Dna-spor har ført til ny teori om ruten til Amerika

Liveblog fra OL: Følg danskerne, stjernerne og de store begivenheder

Cancellara tog OL-guld i enkeltstart

---

What if we also wanted the links embedded in those headlines?

```
jp.links = link %>%  
  read_html(encoding = "UTF-8") %>%  
  html_nodes(css = css.selector) %>%  
  html_attr(name = 'href')
```

---

<http://finans.dk/finans/erhverv/ECE8904112/truende-milli>  
<http://jyllands-posten.dk/sport/ol/ECE8909430/hvem-er-me>  
<http://www.jyllands-posten.dk/protected/premium/internat>  
<http://jyllands-posten.dk/nyviden/ECE8909952/de-foerste->  
<http://jyllands-posten.dk/sport/ol/ECE8898888/liveblog-f>  
<http://jyllands-posten.dk/sport/ol/cykling/ECE8909671/ca>

---

We now have `jp.links`, a vector of all the links to news stories from JP's front page

Let's loop through every link and extract some information.

Assume that we're only interested in domestic and international politics

```
jp.keep = jp.links %>%  
  str_detect("politik|indland|international")  
jp.links.clean = jp.links[jp.keep]  
jp.remove.index = jp.links.clean %>%  
  str_detect("protected|premium|finans")  
jp.links.clean = jp.links.clean[!jp.remove.index]
```

```
first.link = jp.links.clean[1]
first.link.text = first.link %>%
  read_html(encoding = "UTF-8") %>%
  html_nodes("#articleText") %>%
  html_text()
```

## [1] "\r\n\t\tKongehuset og Udenrigsministeriet har gj

Let's also grab the author of the article

```
first.link %>%  
  read_html(encoding = "UTF-8") %>%  
  html_nodes(".bylineAuthorName span") %>%  
  html_text()
```

```
## [1] "THOMAS AAGAARD"
```

**Function:** automate the boring stuff.

**Iteration:** apply a function to many elements.

Let's write a function that for each new link will return article text.

```
scrape_jp = function(link){
  my.link = link %>%
    read_html(encoding = "UTF-8")
  author = my.link %>%
    html_nodes(".bylineAuthorName span") %>%
    html_text()
  if (length(author) == 0){ author = NA }
  link.text = my.link %>%
    html_nodes("#articleText") %>%
    html_text()
  if (length(link.text) == 0){ link.text = NA }
  return(data.frame(author = author,
    link = link, text = link.text ))
}
```

Now we can iterate through all the links and grab the data

```
library("purrr")  
jp.article.data = jp.links.clean[1:5] %>%  
  map_df(scrape_jp)
```

## Output

```
## Observations: 5
## Variables: 3
## $ author (chr) "THOMAS AAGAARD", "MADS BONDE BROBERG"
## $ link      (chr) "http://jyllands-posten.dk/politik/ECE
## $ text      (chr) "\r\n\t\tKongehuset og Udenrigsministe
```

1. Go to <http://www.econ.ku.dk/ansatte/vip/>
2. Create a vector of all links to the researcher's personal home page
3. Go to each researchers page and grab their title
4. Create a data frame of all researchers' names and title

# Gathering data from APIs

API: Application Program Interface

Programmatic instructions for how to interact with a piece of software

Many data sources have API's - largely for talking to other web interfaces

Consists of a set of methods to search, retrieve, or submit data to, a data source

We can write R code to interface with an API (lot's require authentication though)

Many packages already connect to well-known API's

Most APIs are REST APIs

Implemented in R in `httr` package.

**GET:** Retrieve whatever is specified by the URL

**POST:** Create resource at URL with given data

<https://developer.github.com/v3/issues/>

```
library("httr")  
url = "https://api.github.com/repos/hadley/dplyr/issues"  
get.1 = GET(url, query = list(state = "closed"))  
get.2 = GET(url, query = list(state = "closed",  
                              labels = "bug"))
```

Output from APIs come in one of two formats: **XML** or **JSON**

**JSON**: Javascript Object Notation

- Widely used in web APIs
- Becoming de facto standard for online data format
- Read into **R** with **jsonlite** package

**XML**: Extensible Markup Language

- Less common today
- Read into **R** with **xml2** package

## JSON

```
{  
  "Title": "Frozen",  
  "Year": "2013",  
  "Rated": "PG",  
  "Released": "27 Nov 2013",  
  "Runtime": "102 min",  
  "Genre": "Animation, Adventure, Comedy",  
  "Director": "Chris Buck, Jennifer Lee"  
  ...  
}
```

## XML

```
<?xml version="1.0"?>
<catalog>
  <book id="bk101">
    <author>Gambardella, Matthew</author>
    <title>XML Developer's Guide</title>
    <genre>Computer</genre>
    <price>44.95</price>
    <publish_date>2000-10-01</publish_date>
    <description>An in-depth look at creating applicat
    with XML.</description>
  </book>
```

```
library("jsonlite")
get.1.parsed = content(get.1, as = "text")
get.1.data = fromJSON(get.1.parsed, flatten = TRUE)
get.2.parsed = content(get.2, as = "text")
get.2.data = fromJSON(get.2.parsed, flatten = TRUE)
```

## get.1.data

Luckily, you rarely have to access APIs manually

R already has *a lot of* packages for easy access to many APIs

Check some of them out [here](#)

# twitter

twitterR is an R package which provides access to the Twitter API

Create an app [here](#)

```
library("twitterR")
consumer_key = 'your key'
consumer_secret = 'your secret'
access_token = 'your access token'
access_secret = 'your access secret'

setup_twitter_oauth(consumer_key,
                    consumer_secret,
                    access_token,
                    access_secret)

searchTwitter("#dkpol", n=500)
```

[rfacebook](<https://github.com/pablobarbera/Rfacebook>)

streamR

instaR

rtimes

tuber

ggmap

Another useful package is `gmapsdistance`

It uses the [Google Maps Distance Matrix API](#) to compute the distance(s) and time(s) between two points or two vectors of points

```
install.packages("gmapsdistance")
```

```
library("gmapsdistance")  
results = gmapsdistance(origin = "København",  
                          destination = "Roskilde",  
                          mode = "driving")
```

```
## $Time  
## [1] 2125  
##  
## $Distance  
## [1] 34657  
##  
## $Status  
## [1] "OK"
```

Compute walking distance between Marathon and Athens

```
results = gmapsdistance(  
    origin = "38.1621328+24.0029257",  
    destination = "37.9908372+23.7383394",  
    mode = "walking")
```

```
## $Time
## [1] 30025
##
## $Distance
## [1] 39507
##
## $Status
## [1] "OK"
```

```
library("ggmap")  
geocode("Økonomisk Institut,  
Københavns Universitet, København")
```

```
##           lon      lat  
## 1 12.56834 55.6761
```

```
geocode("The White House")
```

```
##           lon      lat  
## 1 -77.03653 38.89768
```

<https://github.com/rOpenGov/dkstat>

Lets you programatically work with Statistics Denmark data

```
library("devtools")  
install_github("rOpenGov/dkstat")
```
